Literature Review

Syaripudin,
2013

- K-Means algorithm has better capabilities than the SOM algorithm and various approaches to hierarchical cluster analysis

Suarna et
al., 2020

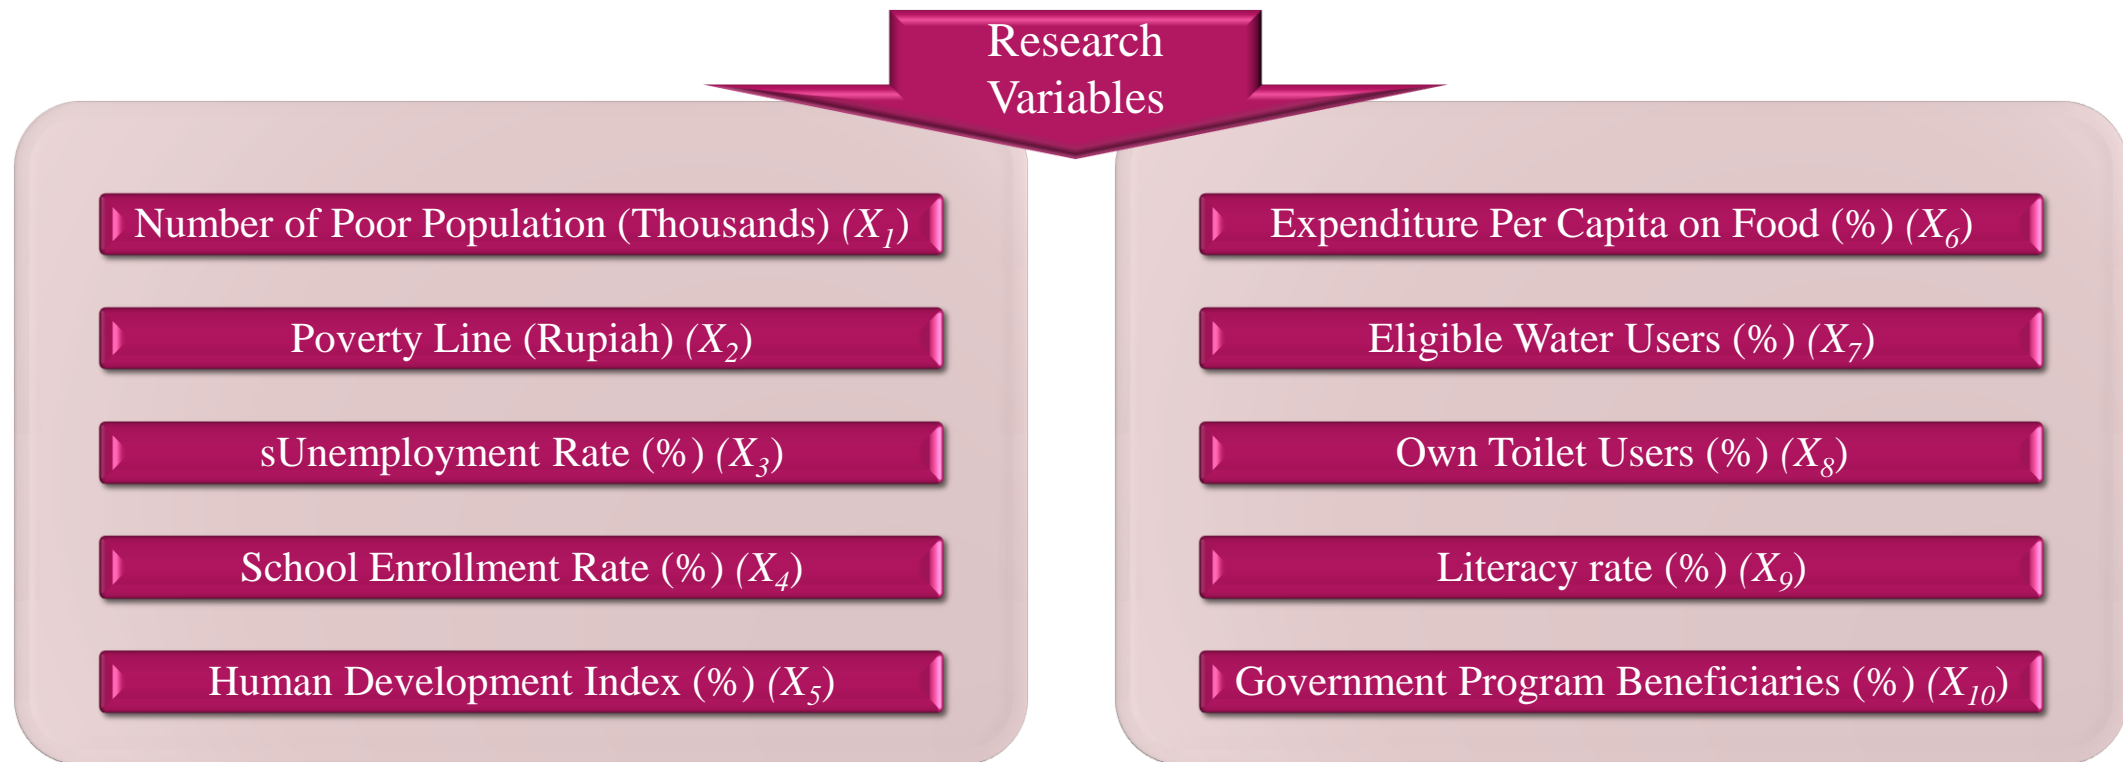

- K-Means method has a more accurate result than the K-Medoids method on the food dataset

Bahauddin
et al., 2021

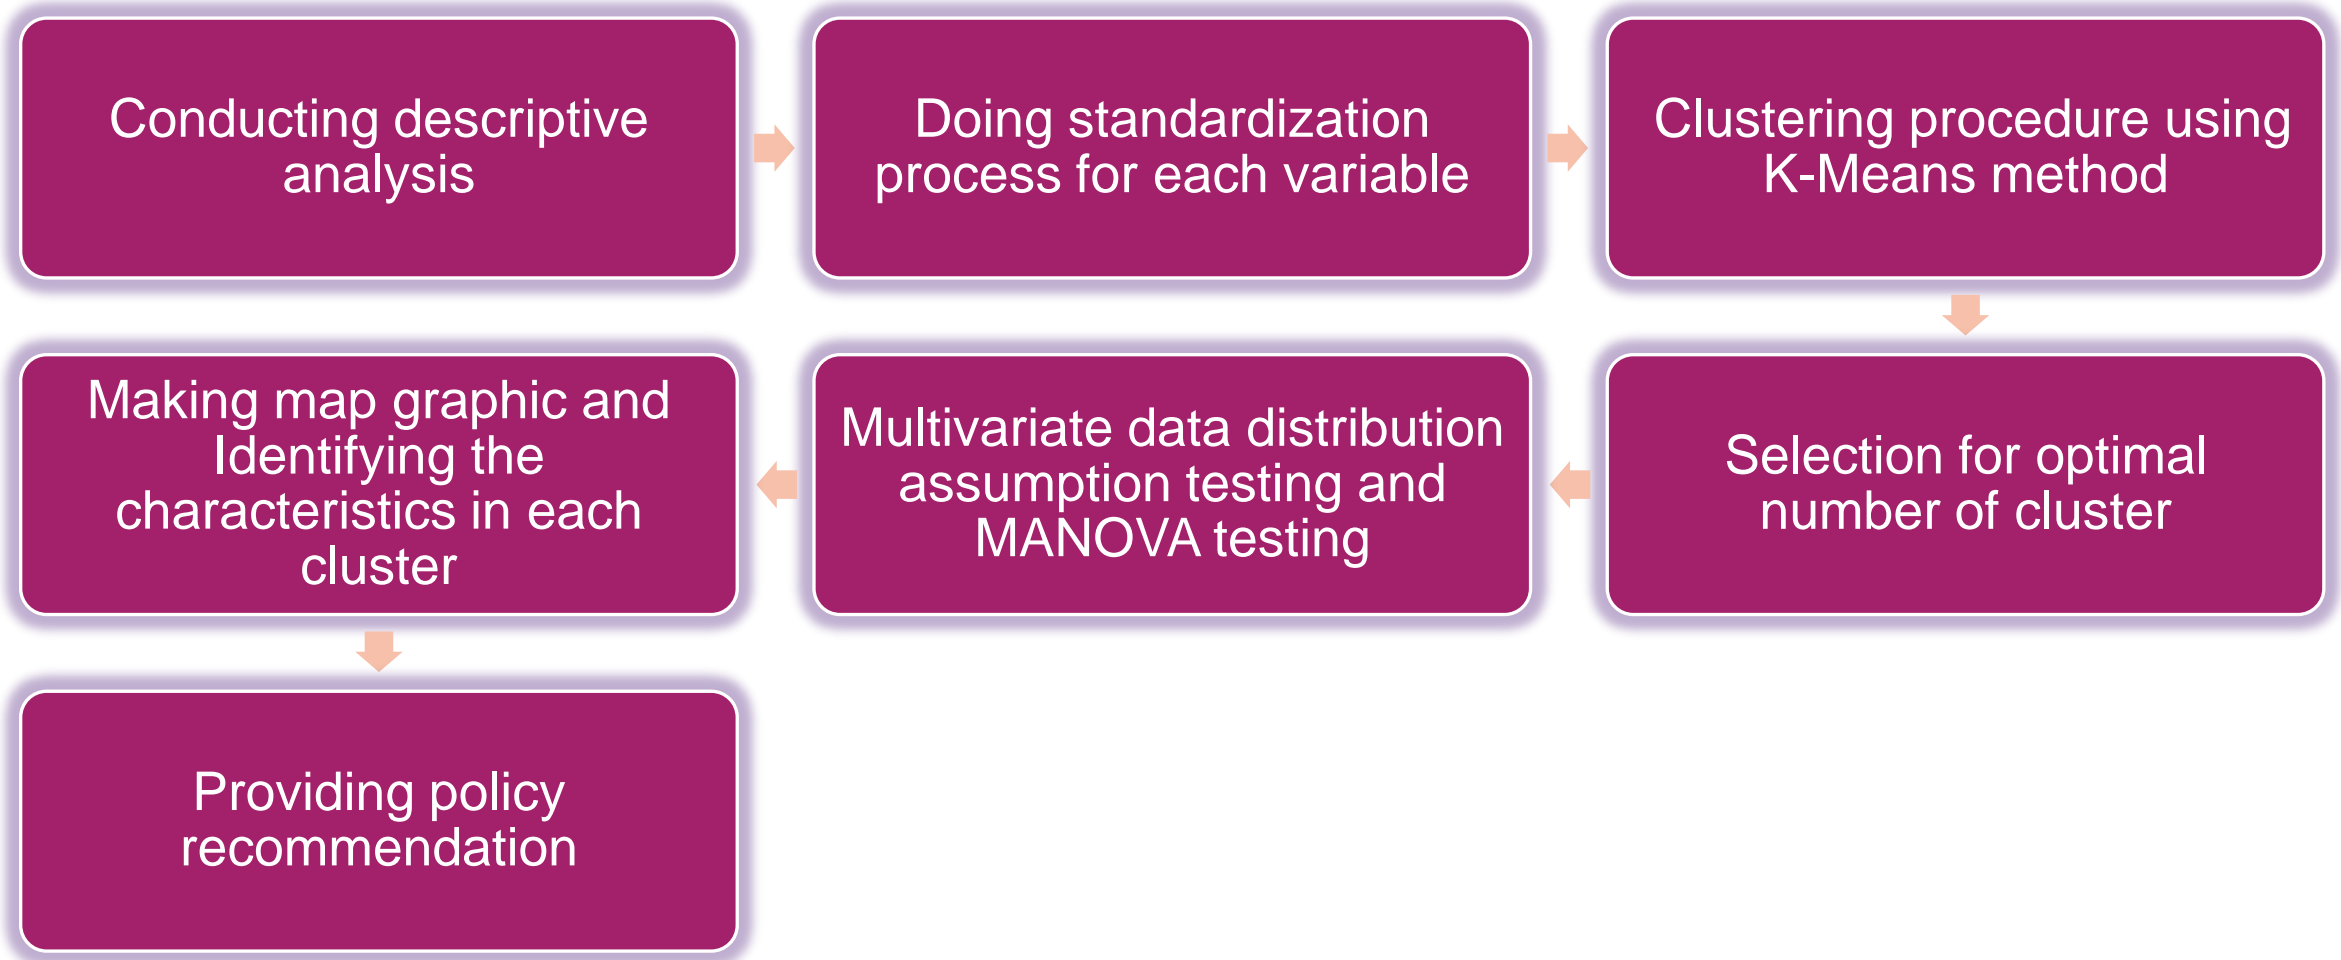

- The use of the K-Means algorithm with the help of Weka software in clustering provinces based on their poverty level in Indonesia produces 3 provincial clusters, namely provinces with low, medium, and high poverty levels

Methodology

The data used in this study were obtained from a publication entitled “Data and Information on District and City Poverty in 2020” published by BPS

Methodology

Result and Discussions

Score Summary of Each Research Variable

Variable	Highest		Lowest	
	Score	Location	Score	Location
Number of Poor Population (X_1)	465,670 people	Bogor District	1,360 people	Sawah Lunto Town
Poverty Line (X_2)	Rp1,021,759	Jayapura City	Rp248,184	Buton Selatan District
Unemployment Rate (X_3)	65.85 %	Tomohon Town	4.16 %	Lanny Jaya District
School Enrollment Rate (X_4)	100 %	139 cities and districts	36.91 %	Puncak District
Human Development Index (X_5)	86.61 %	Yogyakarta City	31.55 %	Nduga District
Expenditure Per Capita on Food (X_6)	82.08 %	Alor District	46.51 %	Ternate City
Eligible Water Users (X_7)	100 %	10 cities and districts	2.12 %	Mamberamo Tengah District
Own Toilet Users (X_8)	100 %	32 cities and districts	2.11 %	Puncak District
Literacy rate (X_9)	100 %	162 cities and districts	16.55 %	Lanny Jaya District
Government Program Beneficiaries (X_{10})	67.27 %	Sabu Raijua District	0 %	38 cities and districts

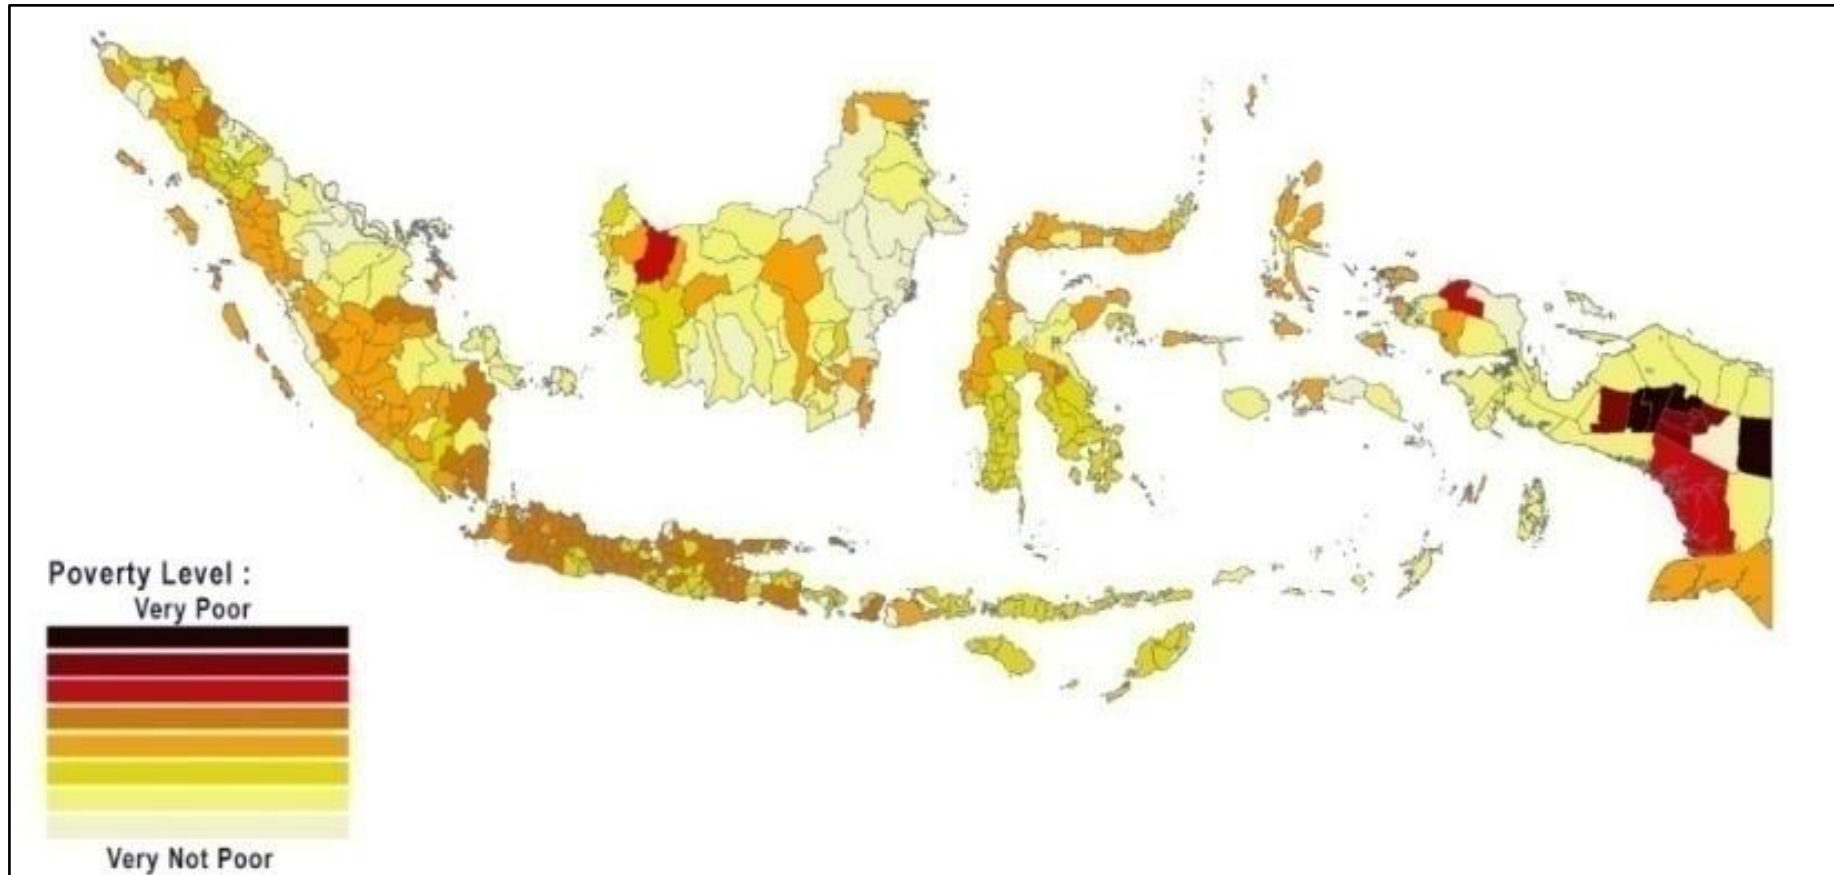

Result and Discussions

Selection for The Optimal Number of Cluster

Number of Clusters	Cluster Goodness Measures	
	Coefficient of Determination	Icd Rate
3	20.01%	79.98%
4	32.52%	67.47%
5	40.71%	59.28%
6	44.78%	55.21%
7	45.95%	54.04%
8	49.79%	50.02%

Cluster Characteristics

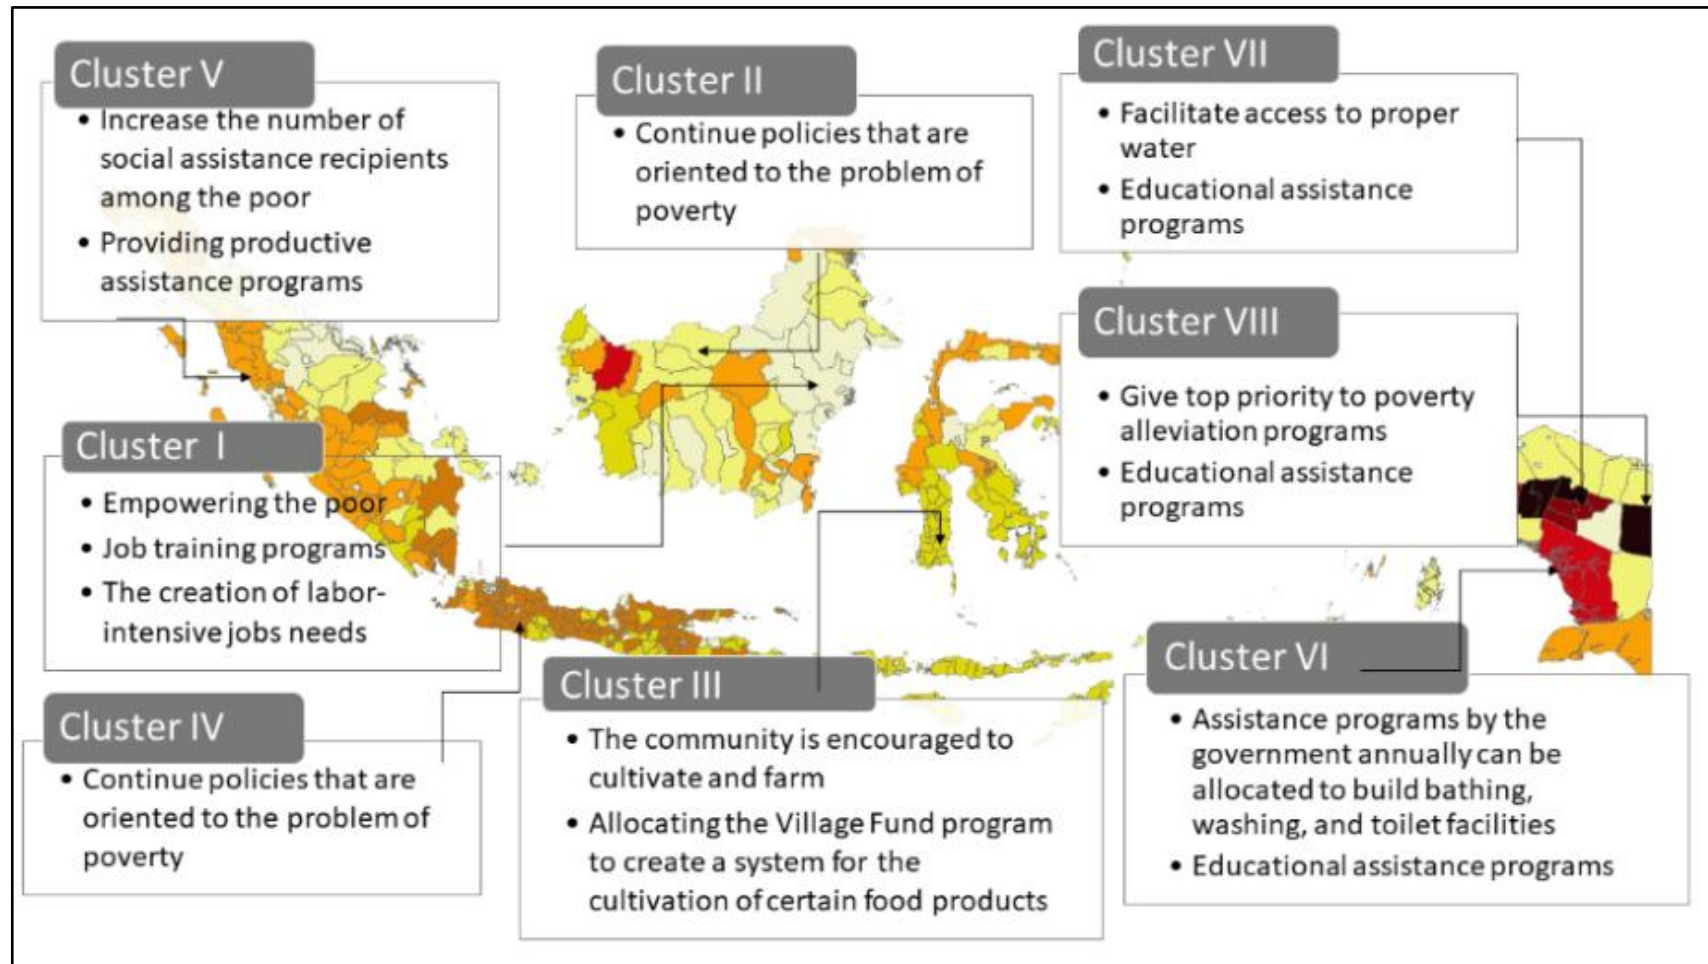

Result and Discussions

Policy Recommendations for Realizing People's Welfare.

Conclusions

By using the K-Means cluster method which is validated with the coefficient of determination and icd rate, 8 clusters of poverty levels are formed. The characteristics of the level of poverty that occur in each regional cluster are very diverse.

In general, the problem of poverty in Indonesia is dominated by the eastern part of Indonesia, especially the province of Papua, which is characterized by low school enrollment and literacy rates. In addition, the percentage of poor households that use eligible water and latrines is the lowest compared to other cities/districts, so the HDI value in this region tends to be below.

Policies that are made need to be adjusted to the main problems in each cluster of districts and cities. Thus, people's welfare can be realized.
